

Senior Challenge '24 Solutions

<h3>1. Pegasus</h3>	
<p>It takes 63.75 minutes to do Deeside to Uffington giving a start time of 11:36:15, which is 1136 to the nearest minute.</p> <p>Leaving Uffington at 1300, the journey to Caen takes 86.25 minutes, arriving at 14:26:15, so 1426 to the nearest minute.</p>	<p>4 marks: (1 mark for 1136, 1 mark for reasoning, 1 mark for 1426, 1 mark for reasoning)</p> <p>Special Case: Award a maximum of 2 marks for correct reasoning, but incorrect rounding.</p>
<h3>2. Triangulum</h3>	
<p>The key thing to remember here is that in any triangle the sum of two sides must always be greater than the third side. For 2 and 4 cm sides, the only possibilities are: (2, 3, 4), (2, 4, 4) and (2, 4, 5).</p> <p>If the largest side is 5cm then there are 22 different triangles: (1, 1, 1), (1, 2, 2), (1, 3, 3), (1, 4, 4), (1, 5, 5), (2, 2, 2), (2, 2, 3), (2, 3, 3), (2, 3, 4), (2, 4, 4), (2, 4, 5), (2, 5, 5), (3, 3, 3), (3, 3, 4), (3, 3, 5), (3, 4, 4), (3, 4, 5), (3, 5, 5), (4, 4, 4), (4, 4, 5), (4, 5, 5), (5, 5, 5).</p>	<p>5 marks: (1 mark for 3, 1 mark for listing (2, 4, X), 1 mark for 22, 3 marks for listing all (X, Y, Z), 1 mark for stating $X+Y>Z$)</p> <p>The marks for listing solutions can be assumed if a good enough explanation is provided.</p>
<h3>3. Eridanus</h3>	
<p>$6r$ is the river's flow in mph and $6V$ is the boat's speed in still water in mph. Lucie goes upstream for 10 minutes, which is $V - r$ miles. The bottle meanwhile has drifted downstream by r. Lucie and the bottle are thus separated by $V - r + r = V$ miles when she turns around. She travels downstream at $(6V + 6r)$ mph. Relative to the bottle, therefore, she travels at $6V$ mph, so it takes her another 10 minutes to close the gap of V miles and catch the bottle. Since the bottle has now travelled 2 miles in twenty minutes, the river flows at 6mph. This can be verified by noting that the boat travels $V + r$ miles downstream in 10 minutes, but had already travelled $V - r$ upstream in 10 minutes, so it is $(V + r) - (V - r) = 2r$ miles downstream from the starting point after 20 minutes. The bottle also travels $2r$ miles downstream in 20 minutes, so they're at the same point after 20 minutes. That means $2r = 2$, so $6r = 6$, which is 6mph.</p>	<p>4 marks: (1 for $V - r$ for upstream, 1 for $V + r$ for downstream, 1 for $2r = 2$ miles or 2 miles in 20 minutes for bottle, 1 for correct answer of 6mph)</p>

Senior Challenge '24 Solutions

<p>4. Camelopardalis, Apus and Monoceros</p> <p>G= number of giraffes, U = number of unicorns, B = number of birds of paradise</p> <p>Equations: Height: $7.5G+2U+0.25B=50$, Number: $G+U+B=100$, Cost: $98G+42U+6B=1000$</p> <p>$G= 2, U = 6, B = 92$</p> <p>So, <u>2 Giraffes, 6 Unicorns and 92 Birds of Paradise</u></p>	<p>6 marks: (1 mark for each equation, 1 mark for each correct answer)</p> <p>Award all 6 marks for correct answers with valid alternative reasoning.</p>
<p>5. Gemini</p> <p><u>29 ways</u> of arranging 5 cubes, including <u>six pairs of twins</u>.</p> 	<p>6 marks: (1 mark for 29, 1 mark for six pairs of twins, 3 marks for drawing them all out, 1 mark for identifying pairs of twins, as shown in the box)</p> <p>29 diagrams – 3 marks 27, 28, 30, 21 – 2 marks 20+ diagrams – 1 mark</p>
<p>6. Canis Major and Canis Minor</p> <p>When Major is finished with a piece of carpet the number of pieces has increased by three (one piece becomes four) and when Minor is finished with a piece the number has increased by six (one piece becomes seven).</p> <p>So, however many times either dog does his or her thing, the number of pieces at the end will have the form $1 + \text{a multiple of } 3$.</p> <p>Now, $2024 = (674 \times 3) + 2$, which is 2 more than a multiple of 3.</p> <p>So, 2024 cannot be the full tally of carpet pieces: there must be at least two more hidden away somewhere.</p>	<p>6 marks: (1 mark for 1 to 4 and 1 to 7, 1 mark for increase by 3 and increase by 6, 1 mark for $1 + 3n$, 1 mark for 2024 isn't all of them 2 marks for reasoning)</p>

Senior Challenge '24 Solutions

7. Sagittarius

This diagram shows a cross-section through the sphere.

Points A and B are on either edge of the crater, point C is at its base. Point D is the midpoint of line AB. Line EF is a diameter of the circle. Point G marks the centre of the circle.

Point H is a point on the edge of the circle (drawn centrally for elegance) The distance from A to B is 240mm, CD is 60mm

$\angle ACD$ is found using $\tan^{-1} \frac{120}{60} \approx \underline{63.4^\circ}$

This makes $\angle ACB \approx \underline{126.9^\circ}$

Then $\angle AHB = 180 - 126.9 \approx \underline{53.1^\circ}$

Then $\angle AGB = 2 \times \angle AHB \approx \underline{106.2^\circ}$

Then $\angle DGB = \frac{1}{2} \angle AGB \approx \underline{53.1^\circ}$

$\triangle DGB$ has a right angle at D, so the length GD is found by using

$$\tan(\angle DGB) = \frac{120}{GD}$$

This rearranges to give us

$$GD = \frac{120}{\tan(\angle DGB)} \approx \frac{120}{\tan(53.1)} = \underline{90\text{mm}}$$

Thus, the radius of the sphere is $GC = 90 + 60 = \underline{150\text{mm}}$.

An alternative approach is to observe that GB and GC are both radii. Denoting the radius as R, we have $GB = R$ and $GD = R - 60$.

Since D is the midpoint of AB, then $DB = 120\text{mm}$.

$\triangle DGB$ has a right angle at D, so, by Pythagoras:

$$R^2 = (R - 60)^2 + 120^2 = R^2 - 120R + 3600 + 14,400.$$

This simplifies to $120R = 18,000$, so $\underline{R = 150\text{mm}}$.

7 marks:

(1 mark for each calculation in the first method

OR

1 mark for GB & GC are radii,

1 mark for $GB = R$,

1 mark for $GD = R - 60$,

1 mark for applying

Pythagoras,

2 marks for the calculation,

1 mark for $R = 150\text{mm}$)

NB There are several other valid ways to solve this.

Award 7 marks for any method with working that produces the right answer.

Special Case:

Allow up to 5 marks if calculations are correct, but rounding error has pushed result off from 150mm.
